

Press Release

Very first charging system for pocket instruments now available from HEINE.

HEINE miniNT® charger

Physicians appreciate the mini3000 line for its compact dimensions and economy. They will be pleased to hear that HEINE now offers a dedicated charging system. Physicians save the money otherwise spent on batteries and have instruments which are always ready to use. What about the handles doctors already have in their practices? The new miniNT charger set from HEINE includes rechargeable batteries and bottom inserts for existing mini3000® handles. But the HEINE mini2000® handle can also be converted instantly.

Safety and quality made in Germany: the charger itself is stable and compact. Instruments are stored safely in the two charging compartments. And the physician needn't worry about how often or how long the instruments are placed in the charger. There is no memory effect and, thanks to the overcharge protection feature, the charging process stops automatically when the battery is full – with direct charge status indication. It only takes four hours to completely charge the handle. All in all, ideal conditions for smooth, efficient operation.
