

PRESSE-RELEASE

HEINE wins the iF product design award 2010

Prestigious design award for the HEINE NT300® charger, mini NT and HEINE BETA® hand-held diagnostic instruments.

Every product which receives the coveted iF award 2010 has to be judged by an international jury of experts. Any such products must excel with exceptional design combined with innovation and quality to enable them to be selected in one of the most demanding design competitions worldwide. This year, designers and manufacturers from 57 countries submitted more than 5000 products.

Optimum performance and quality - that is what makes the HEINE NT300® special. As a result of its compact, innovative design the instruments take up less working space. The fast charge in just two hours for the Lithium batteries means that the practitioner can use his instruments virtually non-stop. The even more compact HEINE mini NT® charger is equally well-balanced despite its small size. No wonder the jury awarded the iF product design award 2010 to both chargers.

But that is not the whole story: The HEINE BETA® range of hand-held diagnostic instruments for eye, ear and skin examination also received the design award. One of the technical highlights: The dramatic reduction in charging time for the Lithium batteries. The successful HEINE BETA® hand-held range of instruments features interchangeable instrument heads for use in a wide range of examination procedures. A lifetime investment in quality for any practitioner.

HEINE's innovative products excel in comparison with other manufacturers' offerings. Direct comparisons show that HEINE is one of the major innovative forces in the market. Generations of practitioners from all specialties have found from experience that the investment in HEINE products is a guarantee for exceptional quality and performance.
